

# PROJECT Design Documentation

---

*The following template provides the headings for your Design Documentation. As you edit each section make sure you remove these commentary 'blockquotes'; the lines that start with a > character and appear in the generated PDF in italics.*

## Team Information

- Team name: Toronto Maple Leafs
- Team members
  - Domenic Lo Iacono
  - Niccolls Evsseef
  - Claire Kreisel
  - Ming Creekmore

## Executive Summary

This project is a full stack application including a persistent storage, backend, and user interface. The goal of this application is to host a jersey store for the Toronto Maple Leafs. As an online store, the admin is able to manage the site by adding and removing jerseys, editing existing jerseys, and other site features. Furthermore, users that visit the site are able to browse through the jerseys available for sale, view specific jersey's attributes like cost, search for jerseys, and lastly add items to their shopping cart and buy the items in that cart.

## Purpose

*Provide a very brief statement about the project and the most important user group and user goals.*

## Glossary and Acronyms

*Provide a table of terms and acronyms.*

Term	Definition
SPA	Single Page

## Requirements

This section describes the features of the application.

*In this section you do not need to be exhaustive and list every story. Focus on top-level features from the Vision document and maybe Epics and critical Stories.*

## Definition of MVP

*Provide a simple description of the Minimum Viable Product.*

## MVP Features

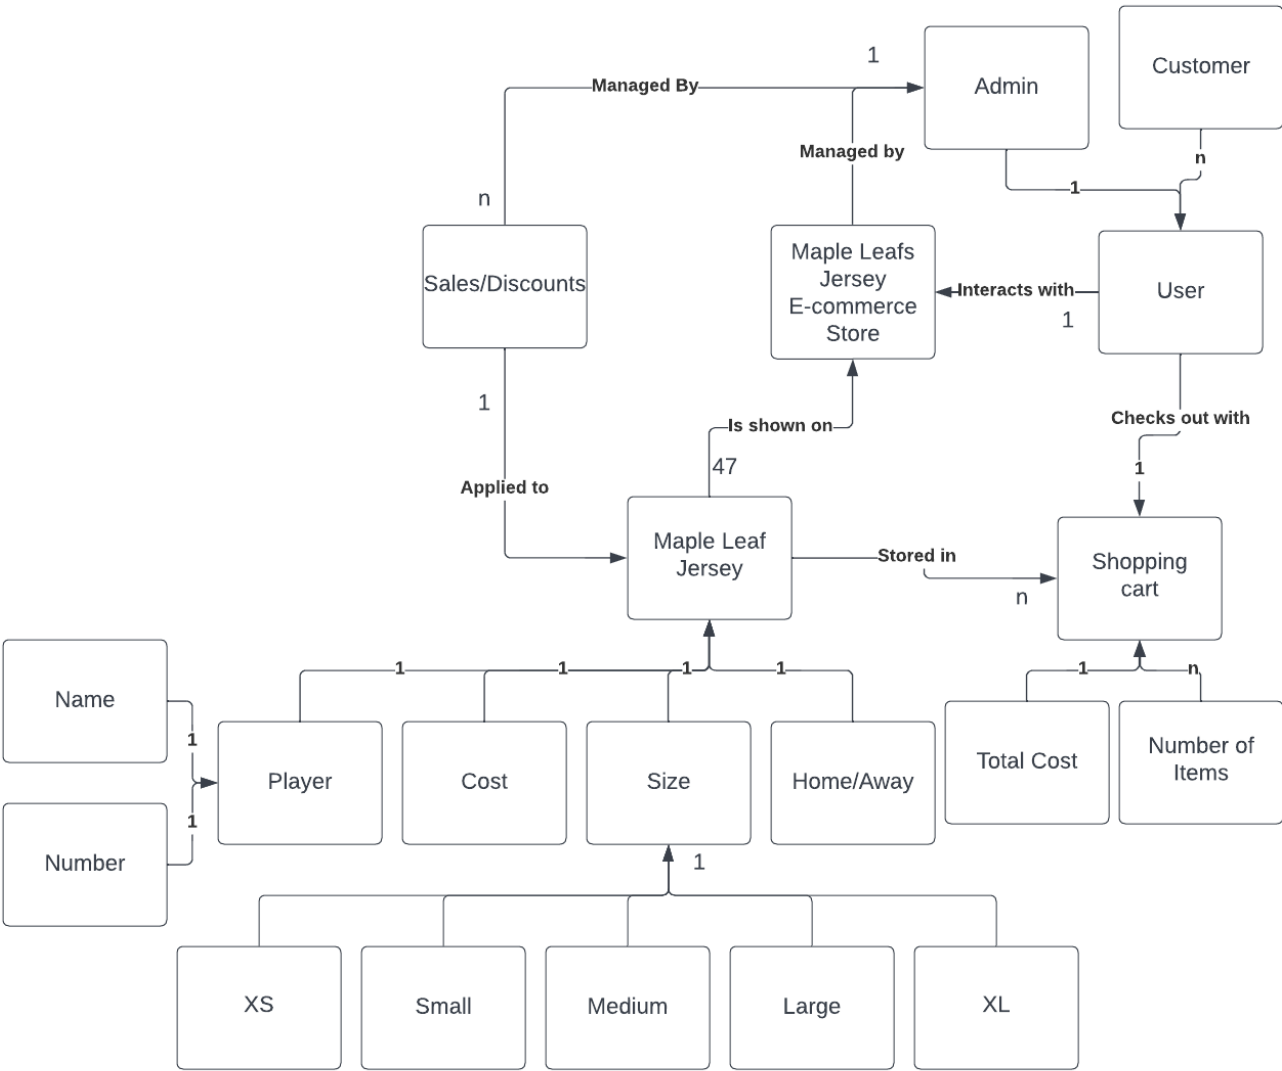

Provide a list of top-level Epics and/or Stories of the MVP.

Roadmap of Enhancements

Provide a list of top-level features in the order you plan to consider them.

Application Domain

This section describes the application domain.

This is a Noun/Verb analysis relating to our domain model which is now represented in code through various classes.

Nouns: Jerseys Number Name Home/away Cost Size XS Small Medium Large XL

Store

User Admin Customer

Shopping Carts Number of items Total cost

Sales/discounts

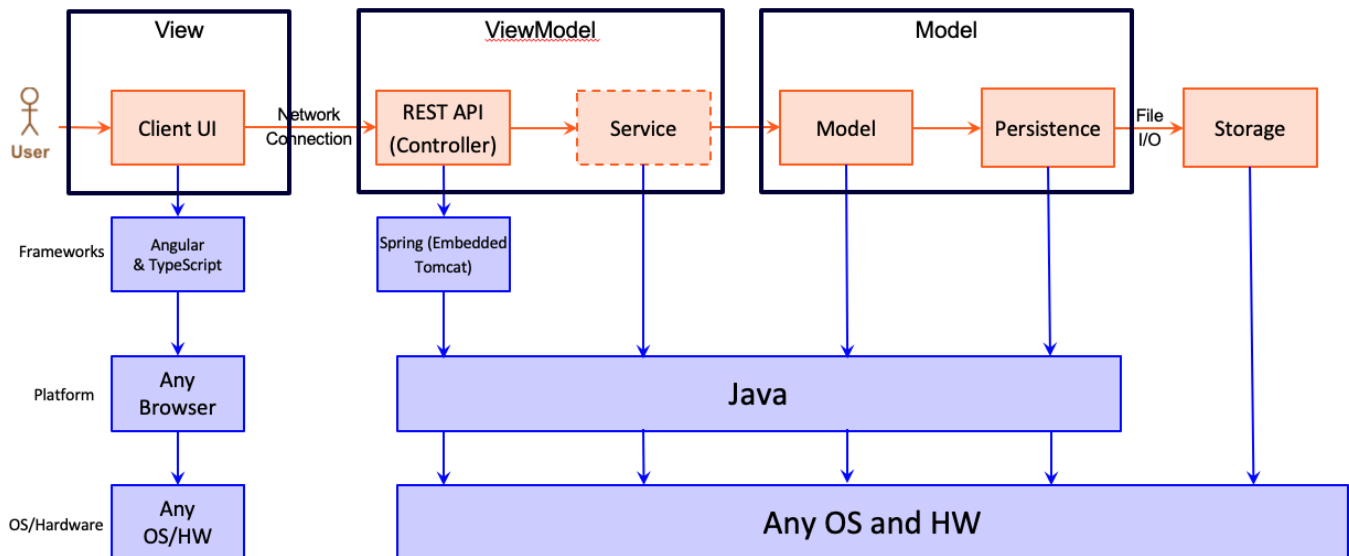

Verbs: Adding (Jerseys to store inventory and shopping cart) Editing (Jerseys to store inventory and shopping cart) Deleting (Jerseys to store inventory and shopping cart) Searching for jerseys Browsing the site/jerseys Checkout the shopping cart

## Architecture and Design

This section describes the application architecture.

### Summary

The following Tiers/Layers model shows a high-level view of the webapp's architecture.

The e-store web application, is built using the Model–View–ViewModel (MVVM) architecture pattern.

The Model stores the application data objects including any functionality to provide persistence.

The View is the client-side SPA built with Angular utilizing HTML, CSS and TypeScript. The ViewModel provides RESTful APIs to the client (View) as well as any logic required to manipulate the data objects from the Model.

Both the ViewModel and Model are built using Java and Spring Framework. Details of the components within these tiers are supplied below.

### Overview of User Interface

This section describes the web interface flow; this is how the user views and interacts with the e-store application.

*Provide a summary of the application's user interface. Describe, from the user's perspective, the flow of the pages in the web application.*

### View Tier

*Provide a summary of the View Tier UI of your architecture. Describe the types of components in the tier and describe their responsibilities. This should be a narrative description, i.e. it has a flow or "story line" that the reader can follow.*

*You must also provide sequence diagrams as is relevant to a particular aspects of the design that you are describing. For example, in e-store you might create a sequence diagram of a customer searching for an item and adding to their cart. Be sure to include an relevant HTTP requests from the client-side to the server-side to help illustrate the end-to-end flow.*

## ViewModel Tier

*Provide a summary of this tier of your architecture. This section will follow the same instructions that are given for the View Tier above.*

*At appropriate places as part of this narrative provide one or more static models (UML class diagrams) with some details such as critical attributes and methods.*

## Model Tier

*Provide a summary of this tier of your architecture. This section will follow the same instructions that are given for the View Tier above.*

*At appropriate places as part of this narrative provide one or more static models (UML class diagrams) with some details such as critical attributes and methods.*

## Static Code Analysis/Design Improvements

*Discuss design improvements that you would make if the project were to continue. These improvement should be based on your direct analysis of where there are problems in the code base which could be addressed with design changes, and describe those suggested design improvements.*

*With the results from the Static Code Analysis exercise, discuss the resulting issues/metrics measurements along with your analysis and recommendations for further improvements. Where relevant, include screenshots from the tool and/or corresponding source code that was flagged.*

## Testing

*This section will provide information about the testing performed and the results of the testing.*

### Acceptance Testing

*Report on the number of user stories that have passed all their acceptance criteria tests, the number that have some acceptance criteria tests failing, and the number of user stories that have not had any testing yet. Highlight the issues found during acceptance testing and if there are any concerns.*

### Unit Testing and Code Coverage

*Discuss your unit testing strategy. Report on the code coverage achieved from unit testing of the code base. Discuss the team's coverage targets, why you selected those values, and how well your code coverage met your targets. If there are any anomalies, discuss those.*
